# Week 2 | Atomic design

## Exercise

This weeks exercise you have been given a design to implement and a partially finished solution.

You must complete the solution according to the design using only HTML and CSS.

The exercise should be completed using atomic design principles. The only 1 CSS class is required, and that has already been provided for you - you just need to decide where it is appropriate to use that class. All other elements should be styled by targeting the HTML tag, example:

```
a {
 text-decoration: none;
}
```

## Submitting your work

Please submit your working using the GitHub repository you created in Week 1.

Create a new folder within the repository called /week-2/ and complete all work within this folder.

Once you have completed the exercise, commit and push your changes to GitHub, using a suitable commit message. Then submit your GitHub repository URL using this form:
https://goo.gl/forms/ChmNC6946SqW3WcG2

Note: you will be asked to submit most of the exercises using this method, so if you have not yet completed the week 1 exercises - now is the time to do so!

**Once you have submitted your work, we will send you a completed version of the solution so you can compare your work to ours.**
